BigLab 2D: Multi-user Application with Authentication

What Are We Building This Week?

You will add the possibility of **having multiple users** in your application, enabling them to **authenticate** (i.e., *login* and *logout* functionalities) for managing their films. Non-authenticated users can not be able to see a list of films anymore.

Step-by-step Instructions

- In the front-end, add a new page (with a dedicated route) with a form, which will be used by users to log in. The page should be well structured in terms of needed components and appropriate states. The login form will have two *mandatory* fields: email and password. The login form should be validated before its submission, and you must use proper error messages when inconsistencies are found. Specifically, at least the following checks should be executed:
 - When a field is missing or empty it must be forbidden to send a log-in request to the server.
 - The email should be properly formatted (i.e., *something@something.something*).
- Implement the login process by exploiting the <u>Passport authentication middleware</u> in Express.
 Before implementing the login process, you will have to substitute the already available database with the new version released in the <u>BigLab2 folder on GitHub</u>.
 - Add a new user with username "testuser@polito.it" and password: "password".
 - Create at least three new films in the database and assign them to the newly created user (testuser@polito.it).

Beware: do not store **plain text passwords** in the database! Use **scrypt** (*see the hints*) to generate a hash of the passwords before saving them.

- If you want to add additional users, write their username(s) and the plain text password(s) in the *README.md* file included in your repository.
- When the login process fails, the front-end should display a suitable error message (e.g., "Incorrect username or password") and continue to show the login form. Instead, when the login is successful, the application redirects the users to their film list page, showing a message like: "Welcome, {name_of_the_user}".
- Identify the routes that need to be authenticated (e.g., those to get the list of films) and *protect* them accordingly. Non-authenticated users must not see any film, meanwhile authenticated users must see **only** their films.
- Implement the **logout** functionality, again by exploiting the **Passport** authentication middleware. When the users are logged out, redirect them to the login form.

Hints:

- 1. All the specifications of the BigLab can be found at: <u>https://qithub.com/polito-WA1-AW1-2022/materials/tree/main/labs/BigLab2</u>
- 2. You can find the new version of the server-side database on GitHub: <u>https://qithub.com/polito-WA1-AW1-2022/materials/blob/main/labs/BigLab2/films.db</u>
- 3. Note: You can find in the README file the usernames and passwords of the default users.
- 4. You can use the following website to generate the hash of a password, according to scrypt: <u>https://www.browserling.com/tools/scrypt</u>.
 If you need to generate a salt by hand, you can use <u>https://www.browserling.com/tools/random-hex</u>, considering the length of the generated hex as the one of the salt (e.g., 16).
